ALKALINE WATER

Our alkaline water product is reverse osmosis water that is passed through a pH neutralizing filter composed of 50-percent calcite (calcium carbonate) and 50-percent corosex (magnesium oxide). The filter produces a water that maintains a pH of between 7.8 and 9.8.

Alkaline water can be made in several different ways. Traditionally people have used ionization to produce alkaline water with alkaline water ionizers and alkaline water machines. Although these are effective in producing alkaline water, equipment such as an alkaline water ionizer or alkaline water machine leaves harmful contaminants in the water. This is acceptable when the feed water supply is safe, yet be problematic with certain water conditions. Also ionizers cannot control which minerals are present in the water, so areas with harmful mineral content in the feed water supply may still have the harmful minerals present in the water after ionization.

Finally the alkaline water that is produced through our corosex/calcite filter Remains in the high PH range much longer then Ionizer systems.
